

G2G — Current Progress

Disentanglement by Cross Training

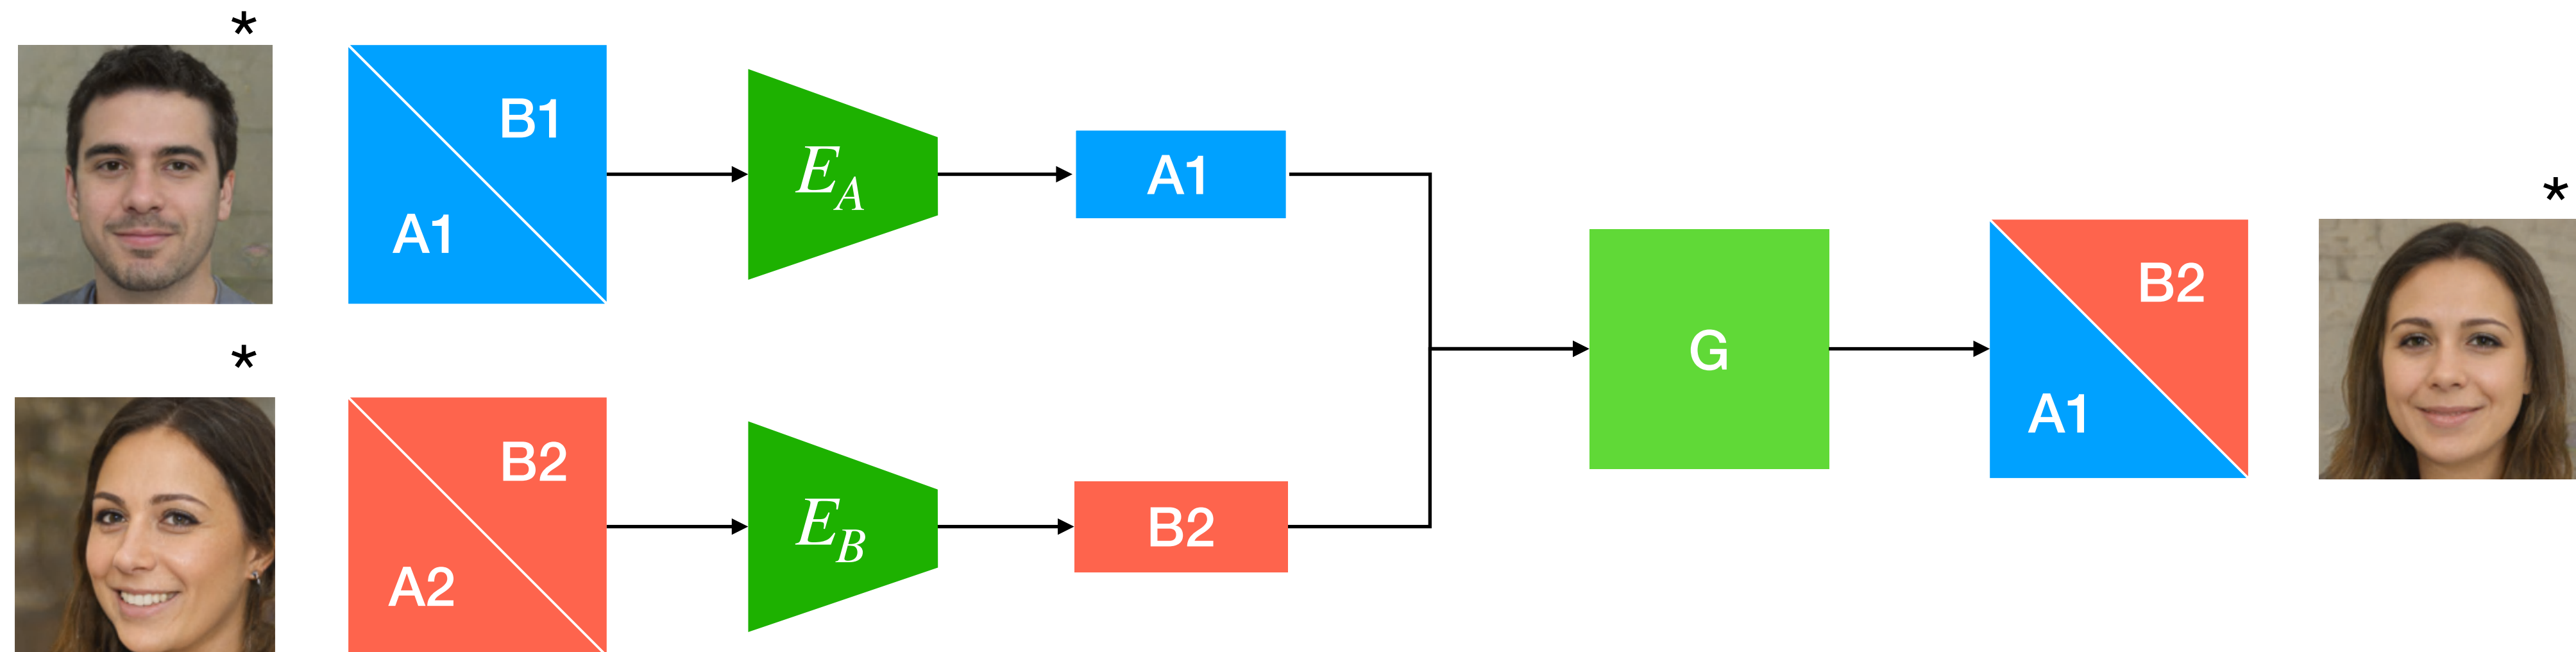

Alexander Koenig, Li Nguyen, Ron Mokady, Prof Daniel Cohen-Or

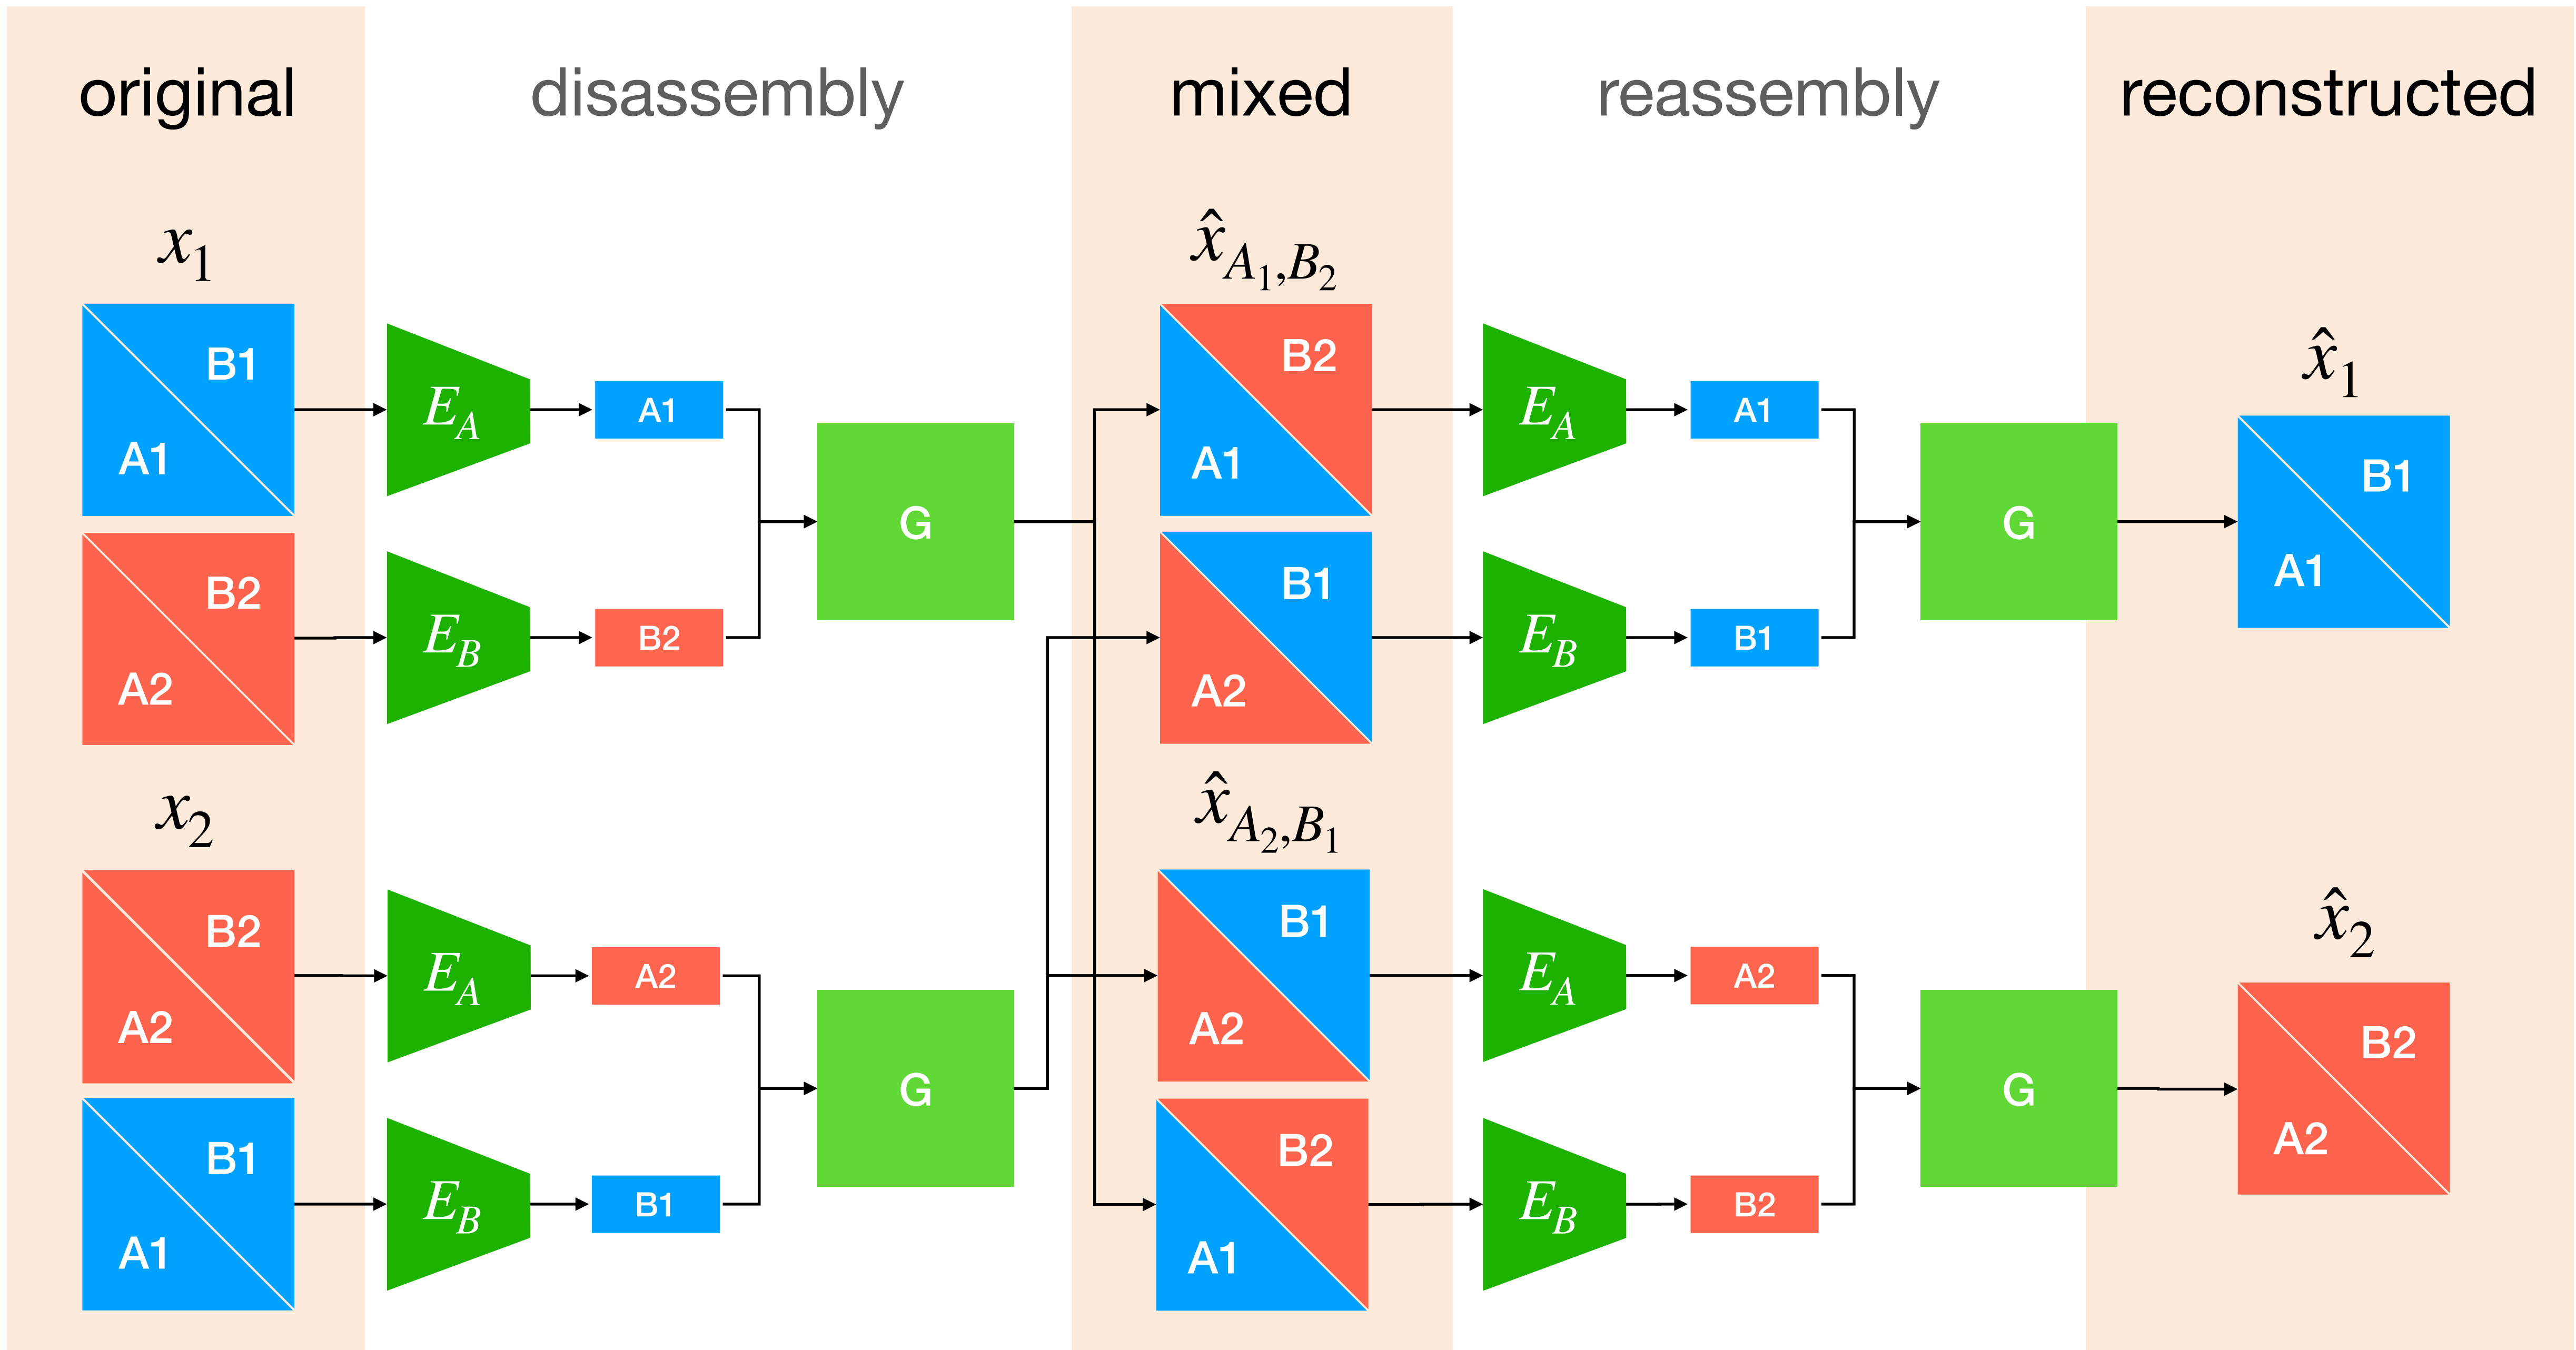

All Images: Disentangling in Latent Space by Harnessing a Pretrained Generator, 2020, Yotam Nitzan et al.

Adding Encoders

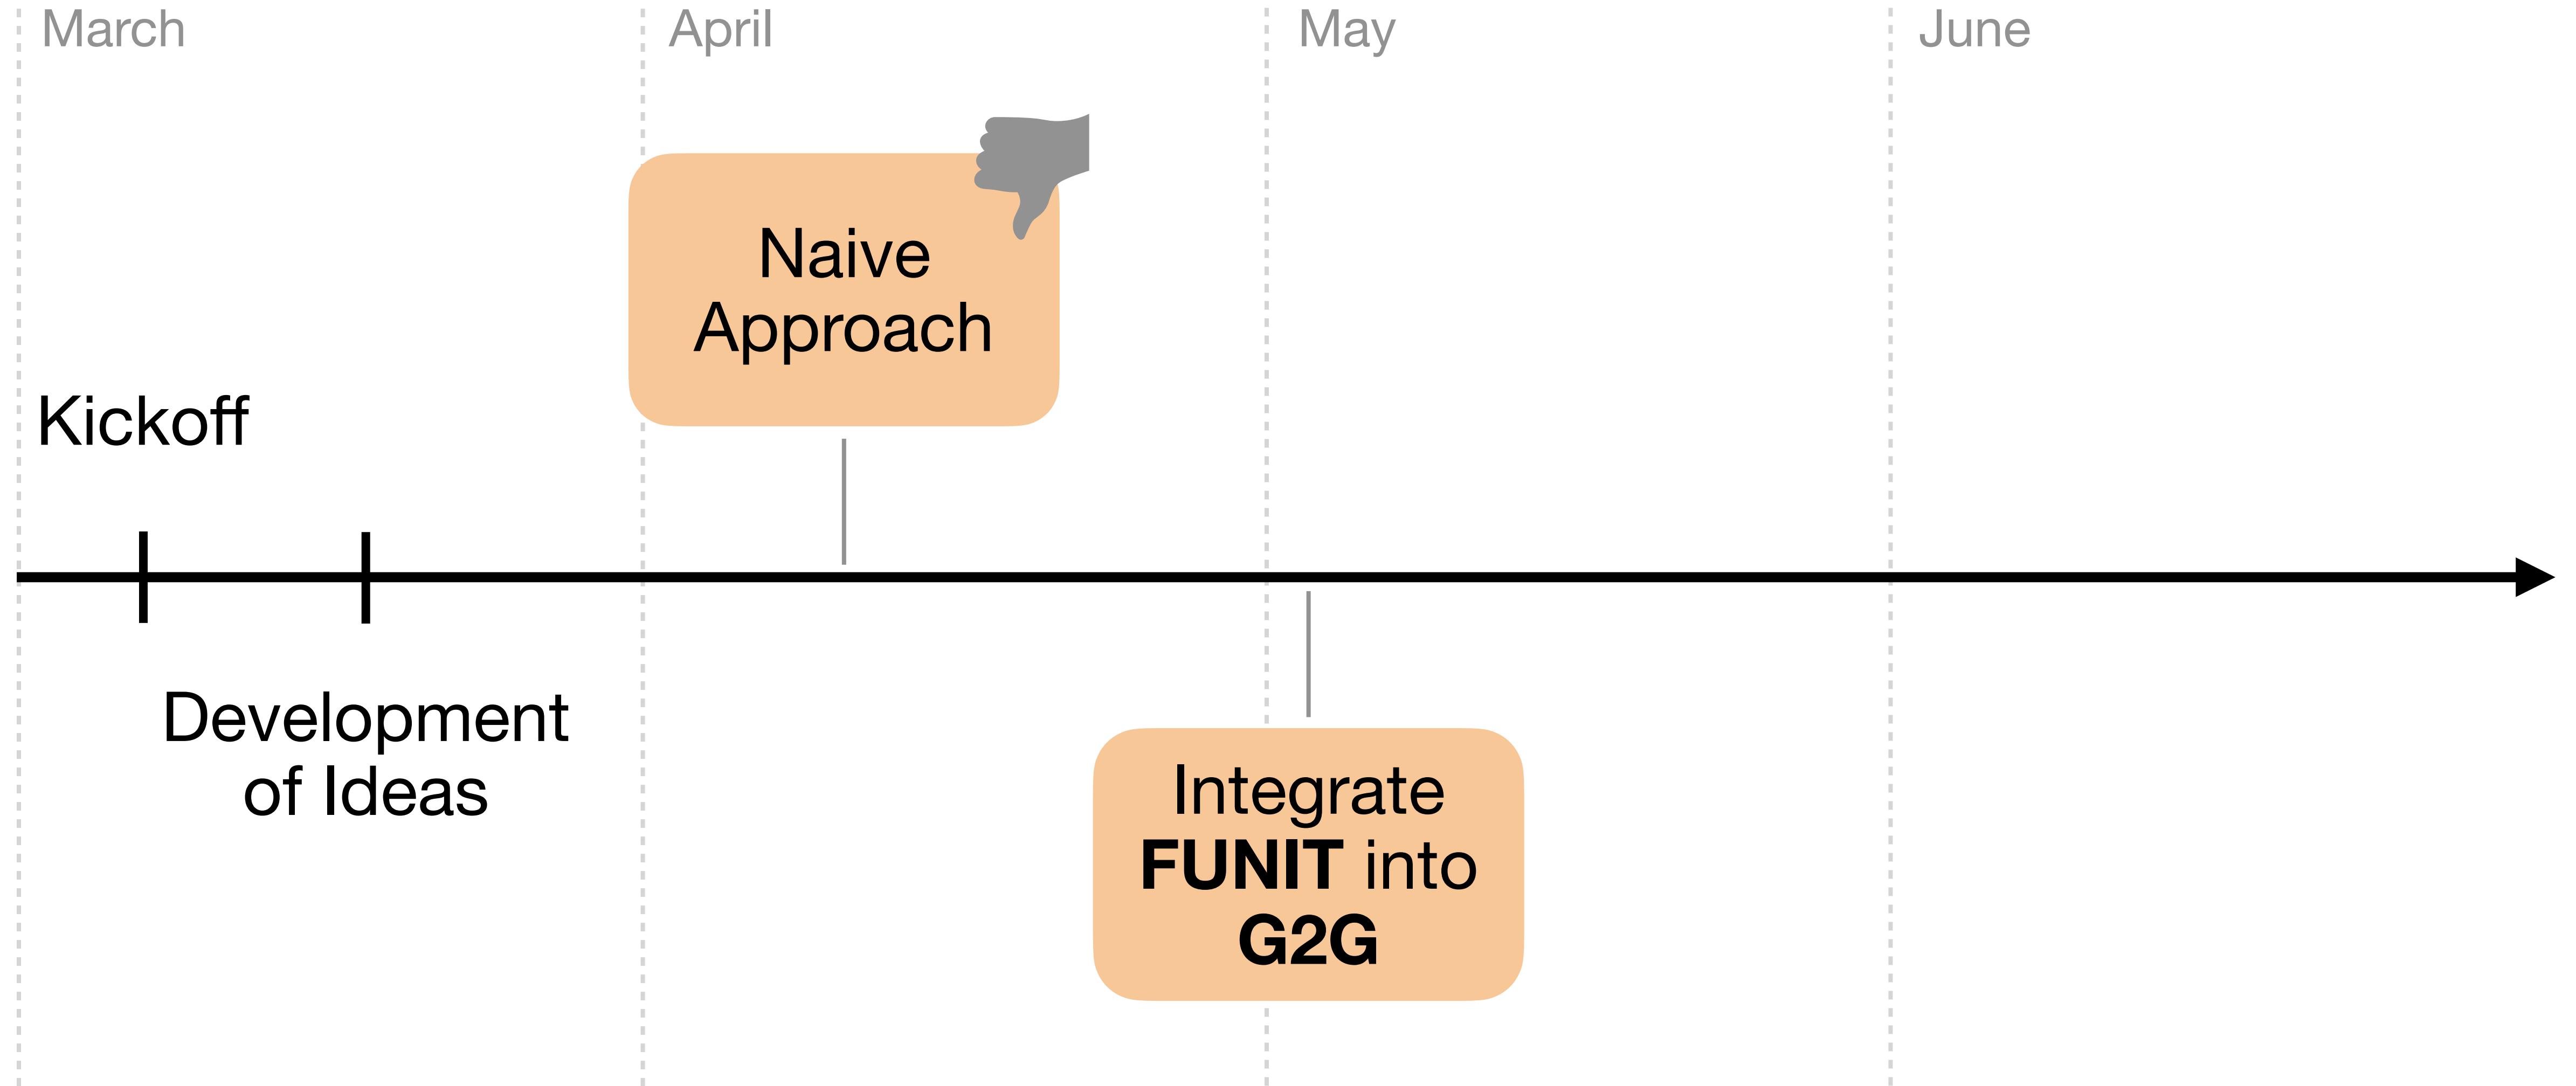

- Let **Encoder** E_A encode **rest**, e.g. pose, facial expression, background, lighting, ...
- Let **Encoder** E_B encode a specific feature: **identity**
- The encoded features A and B should be **disentangled**
- **Generator G** can focus on learning to stitch the encoded features together to a new picture

Goal *

* *Disentangling in Latent Space by Harnessing a Pretrained Generator, 2020, Yotam Nitzan et al.*

Results

Original

Mixed

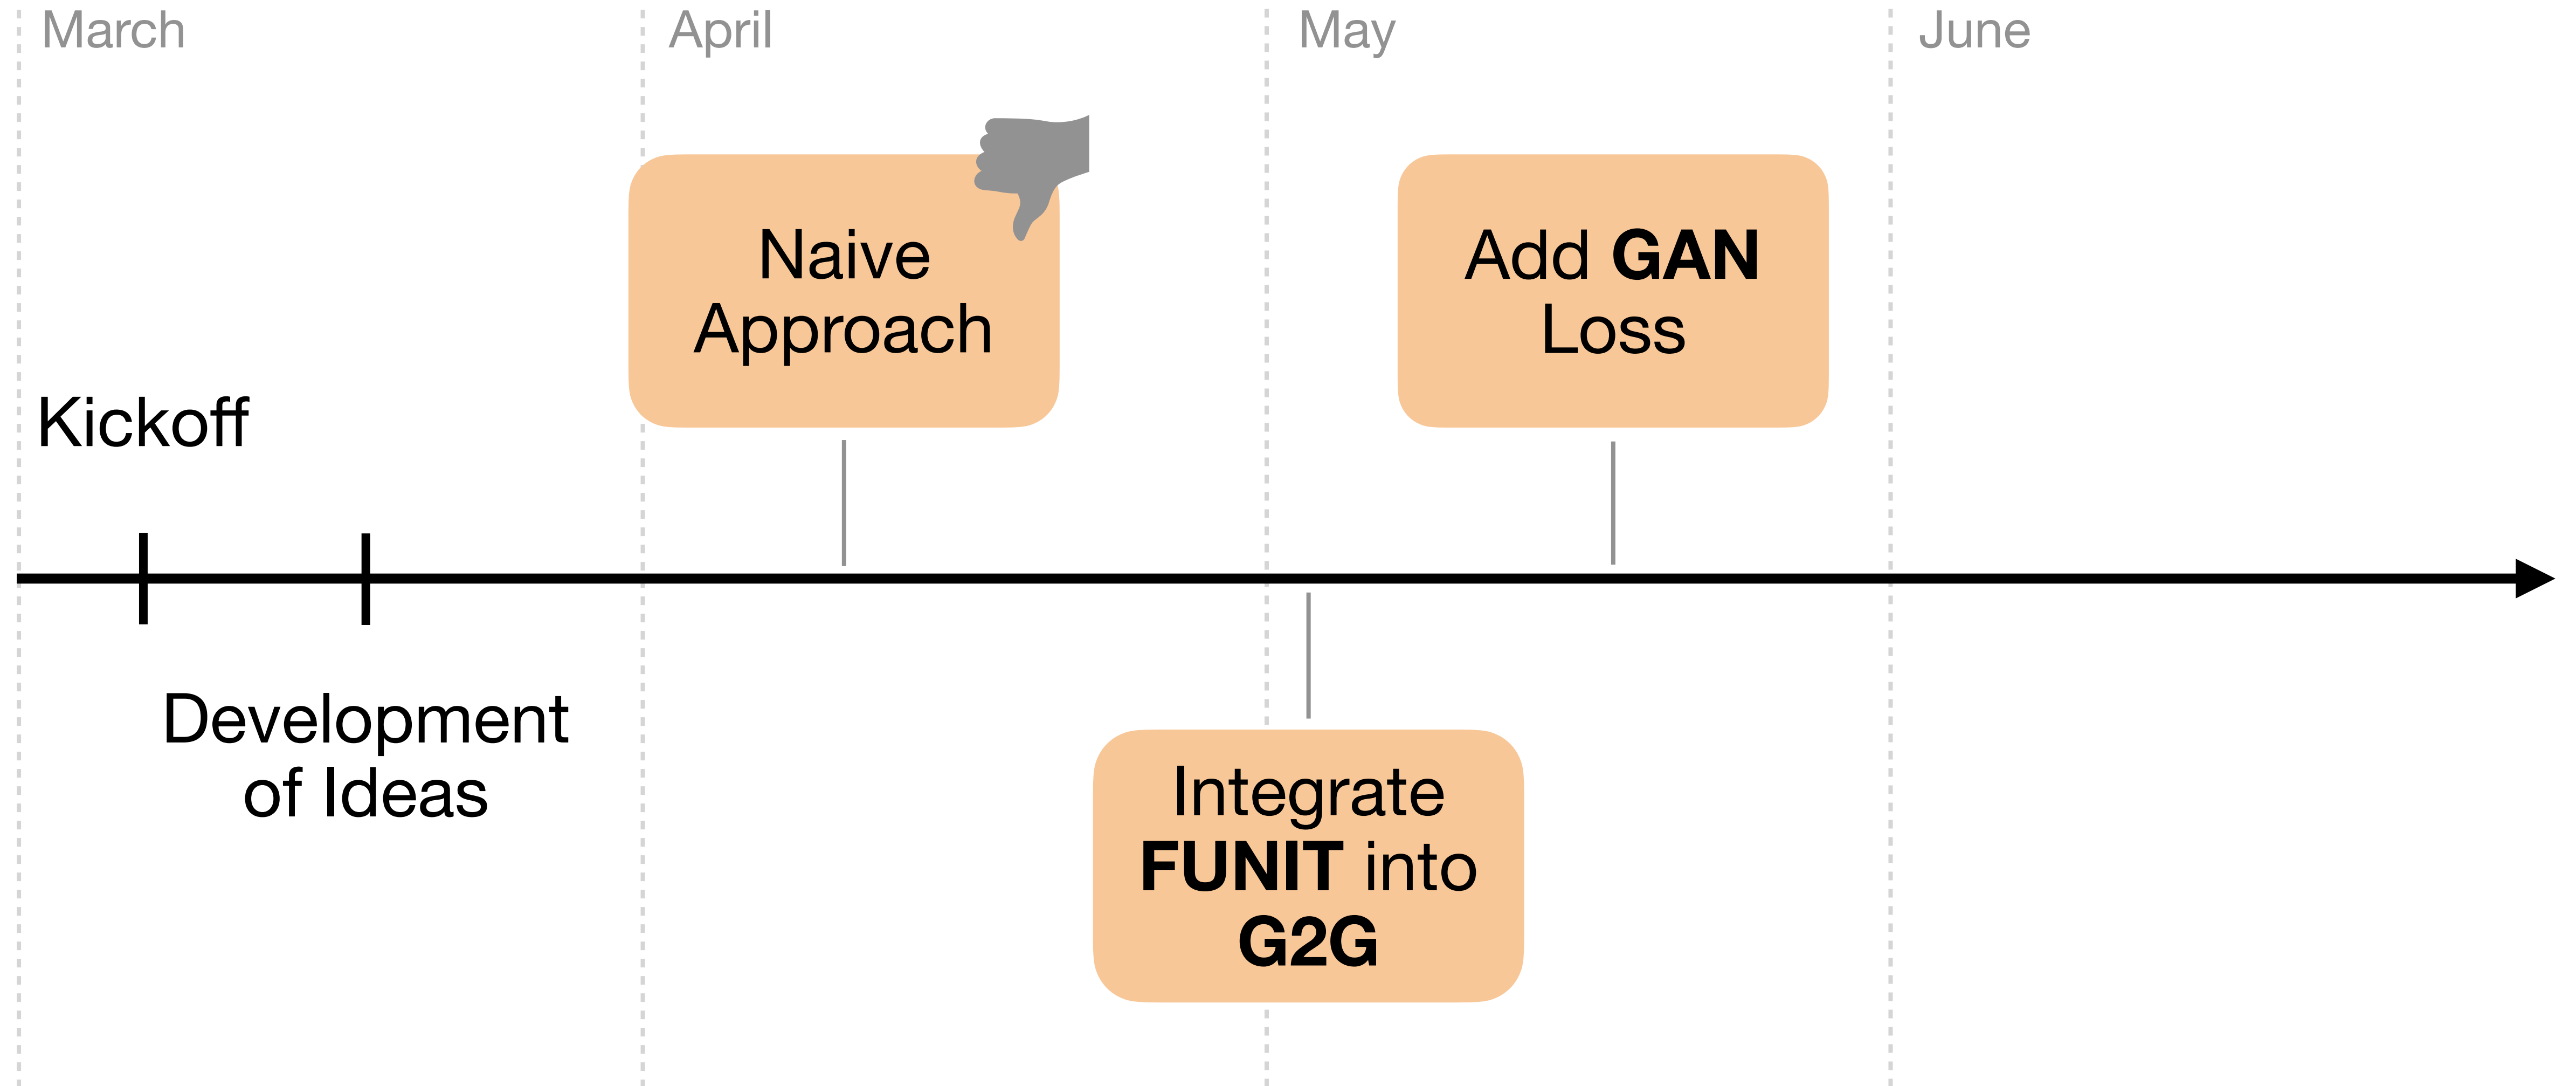

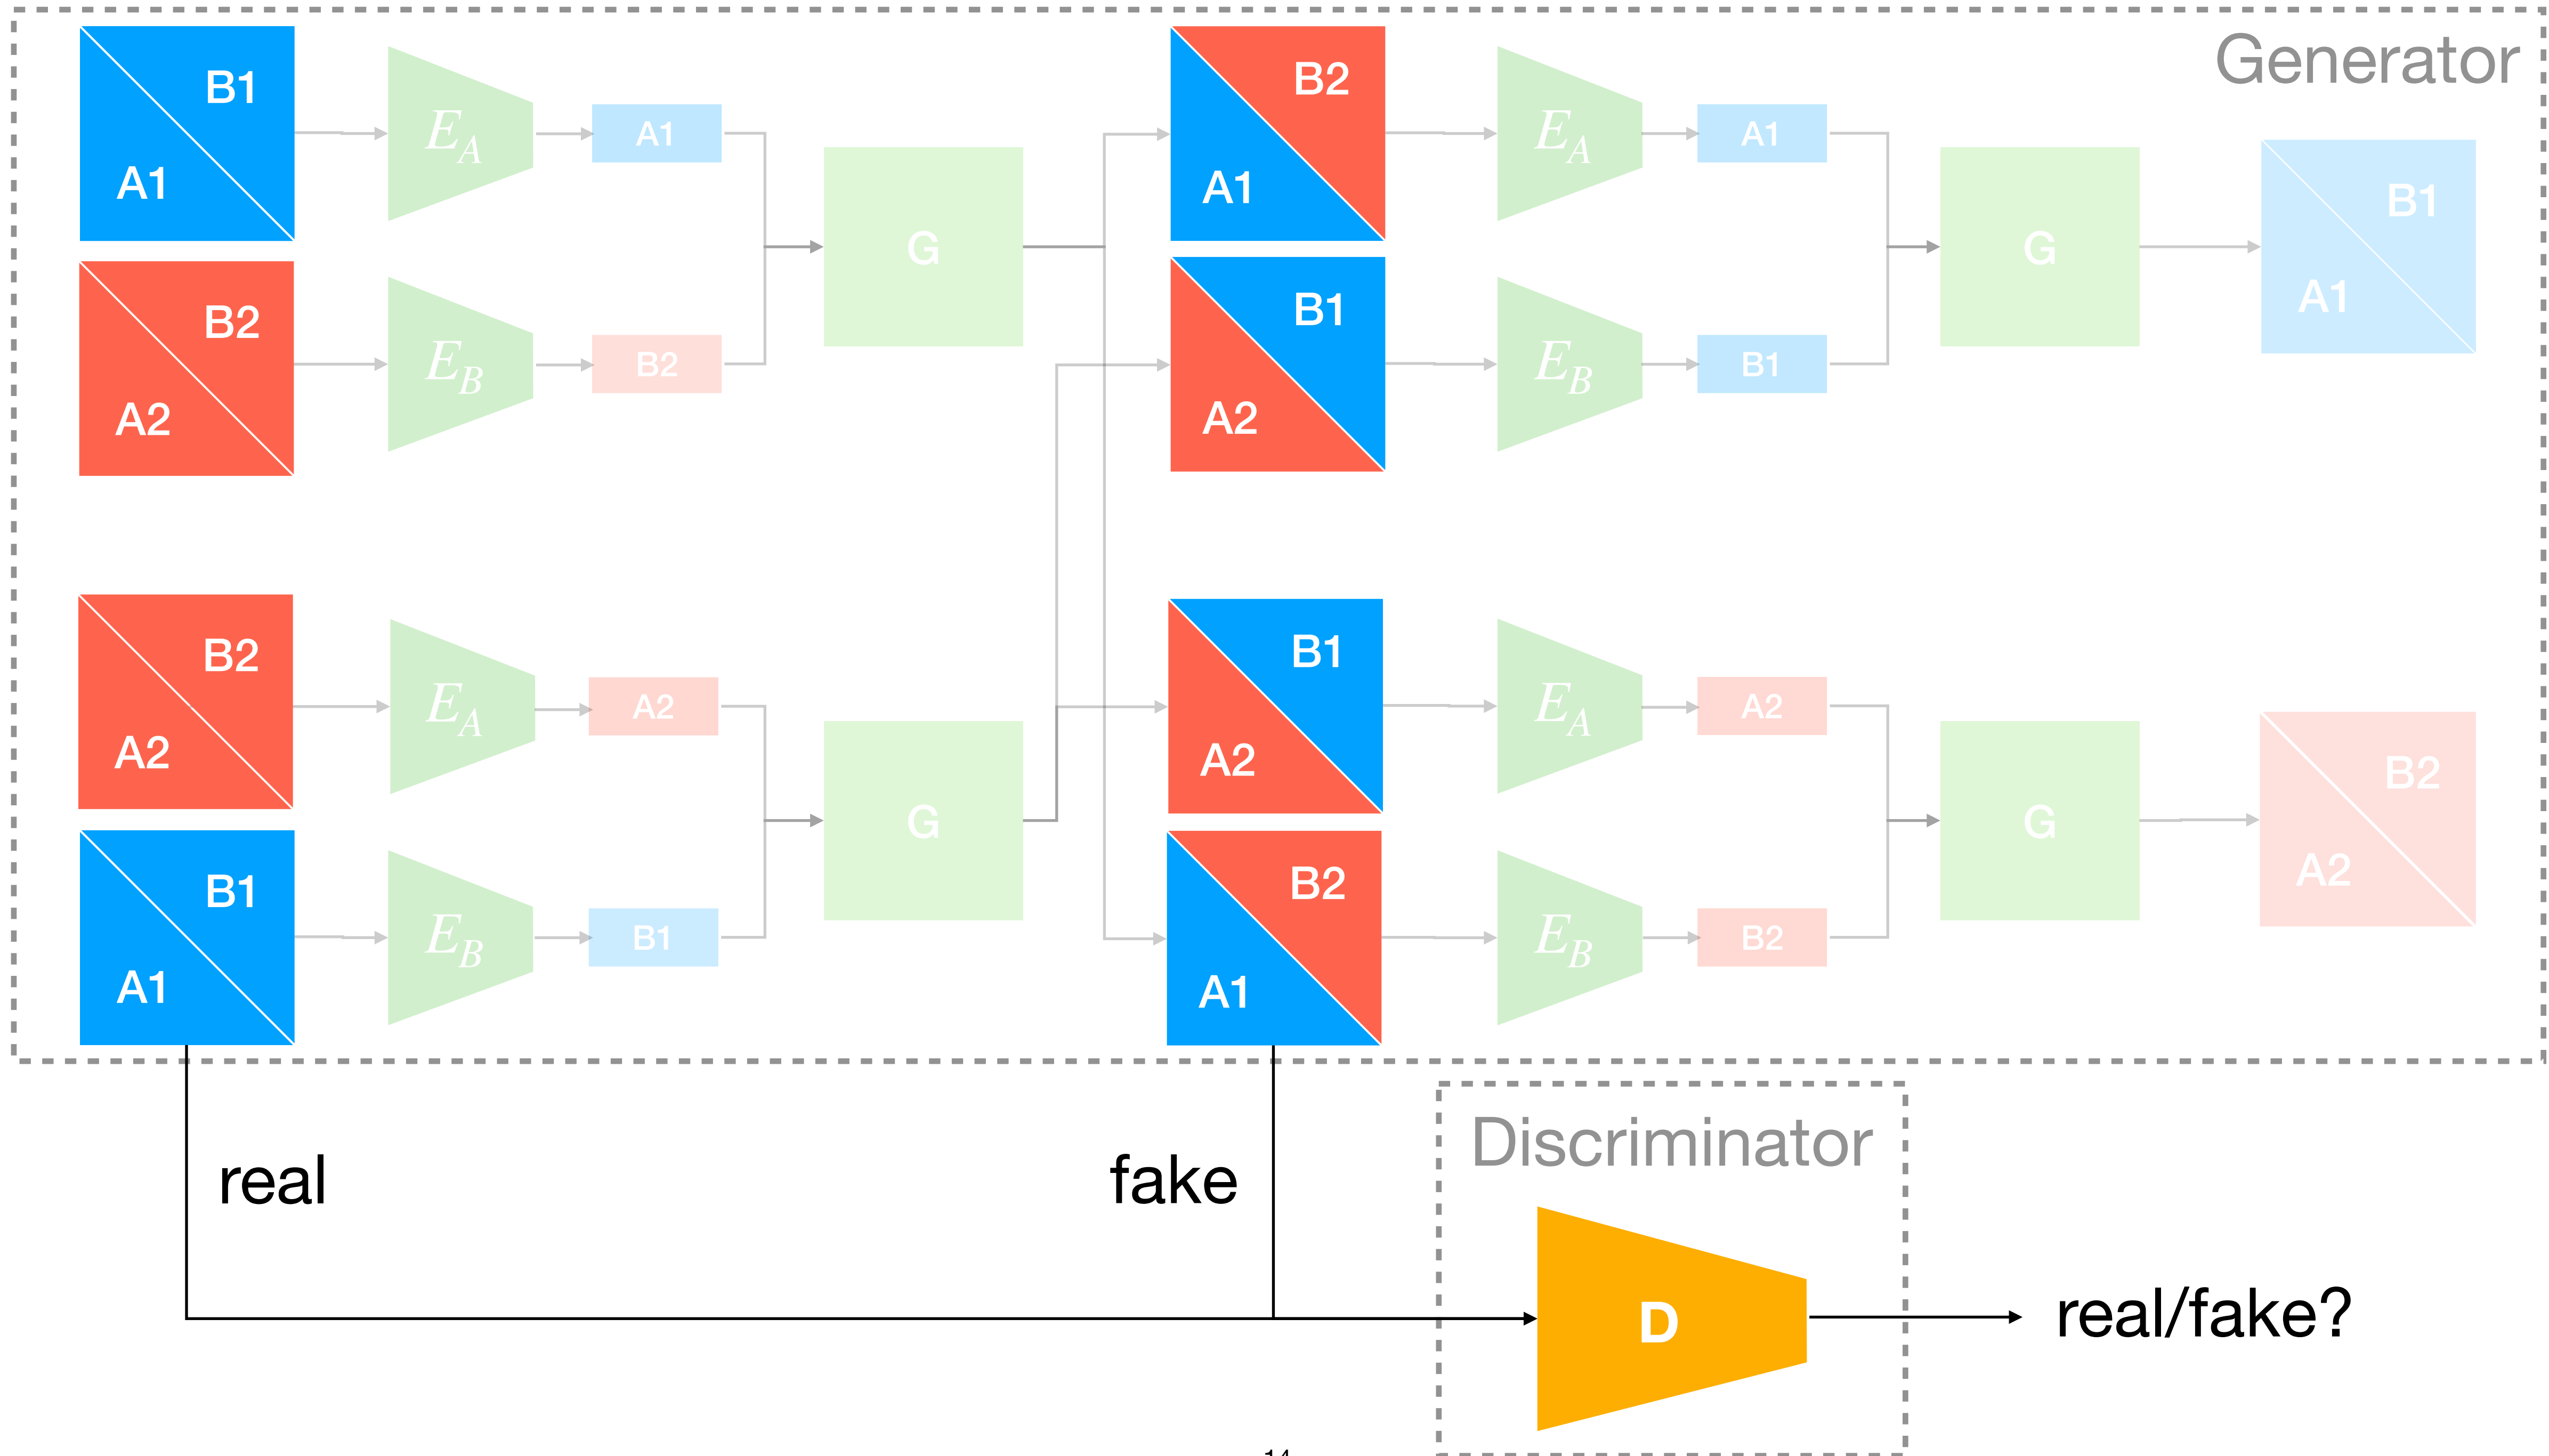

Reconstructed

Epochs: 9, Batch Size: 16, $\gamma = 1.3$

Timeline

Overall Losses

Generator

$$L_{gen} = \alpha \cdot L_{vgg} + \gamma \cdot L_{cyc} + \lambda_g \cdot L_{adv} \quad \text{with } \alpha = 1.0$$

 = VGG Perceptual Loss

 = Cycle Consistency Losses

 = Generator GAN Loss

Discriminator

$$L_{dis} = \zeta \cdot \left(\frac{L_{real} + L_{fake}}{2} \right) \quad \text{with } \zeta = 0.2$$

Results

Original

Mixed

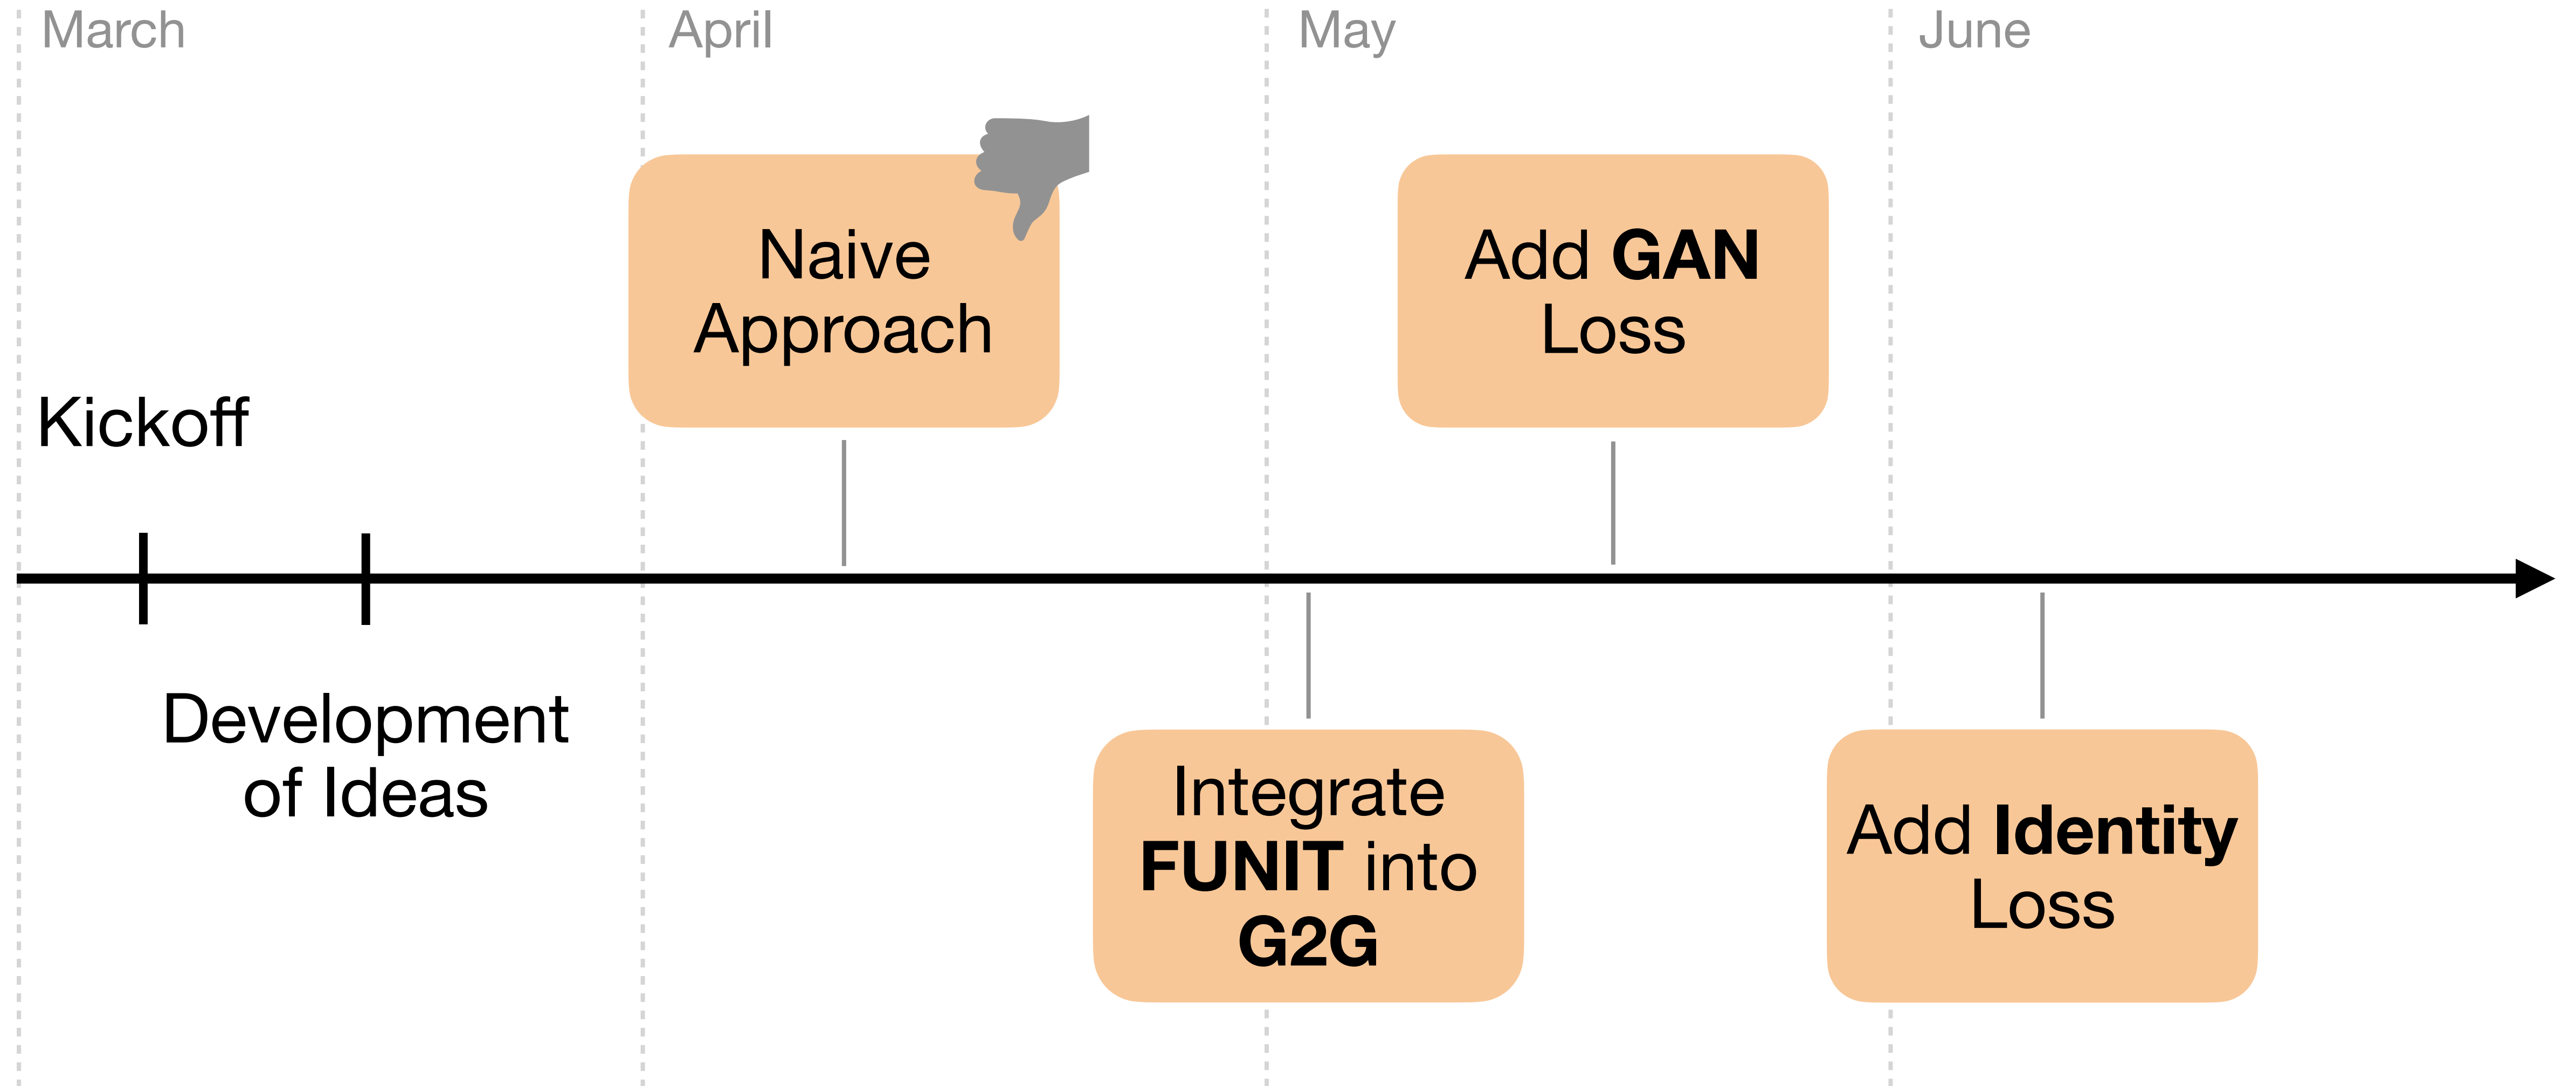

Reconstructed

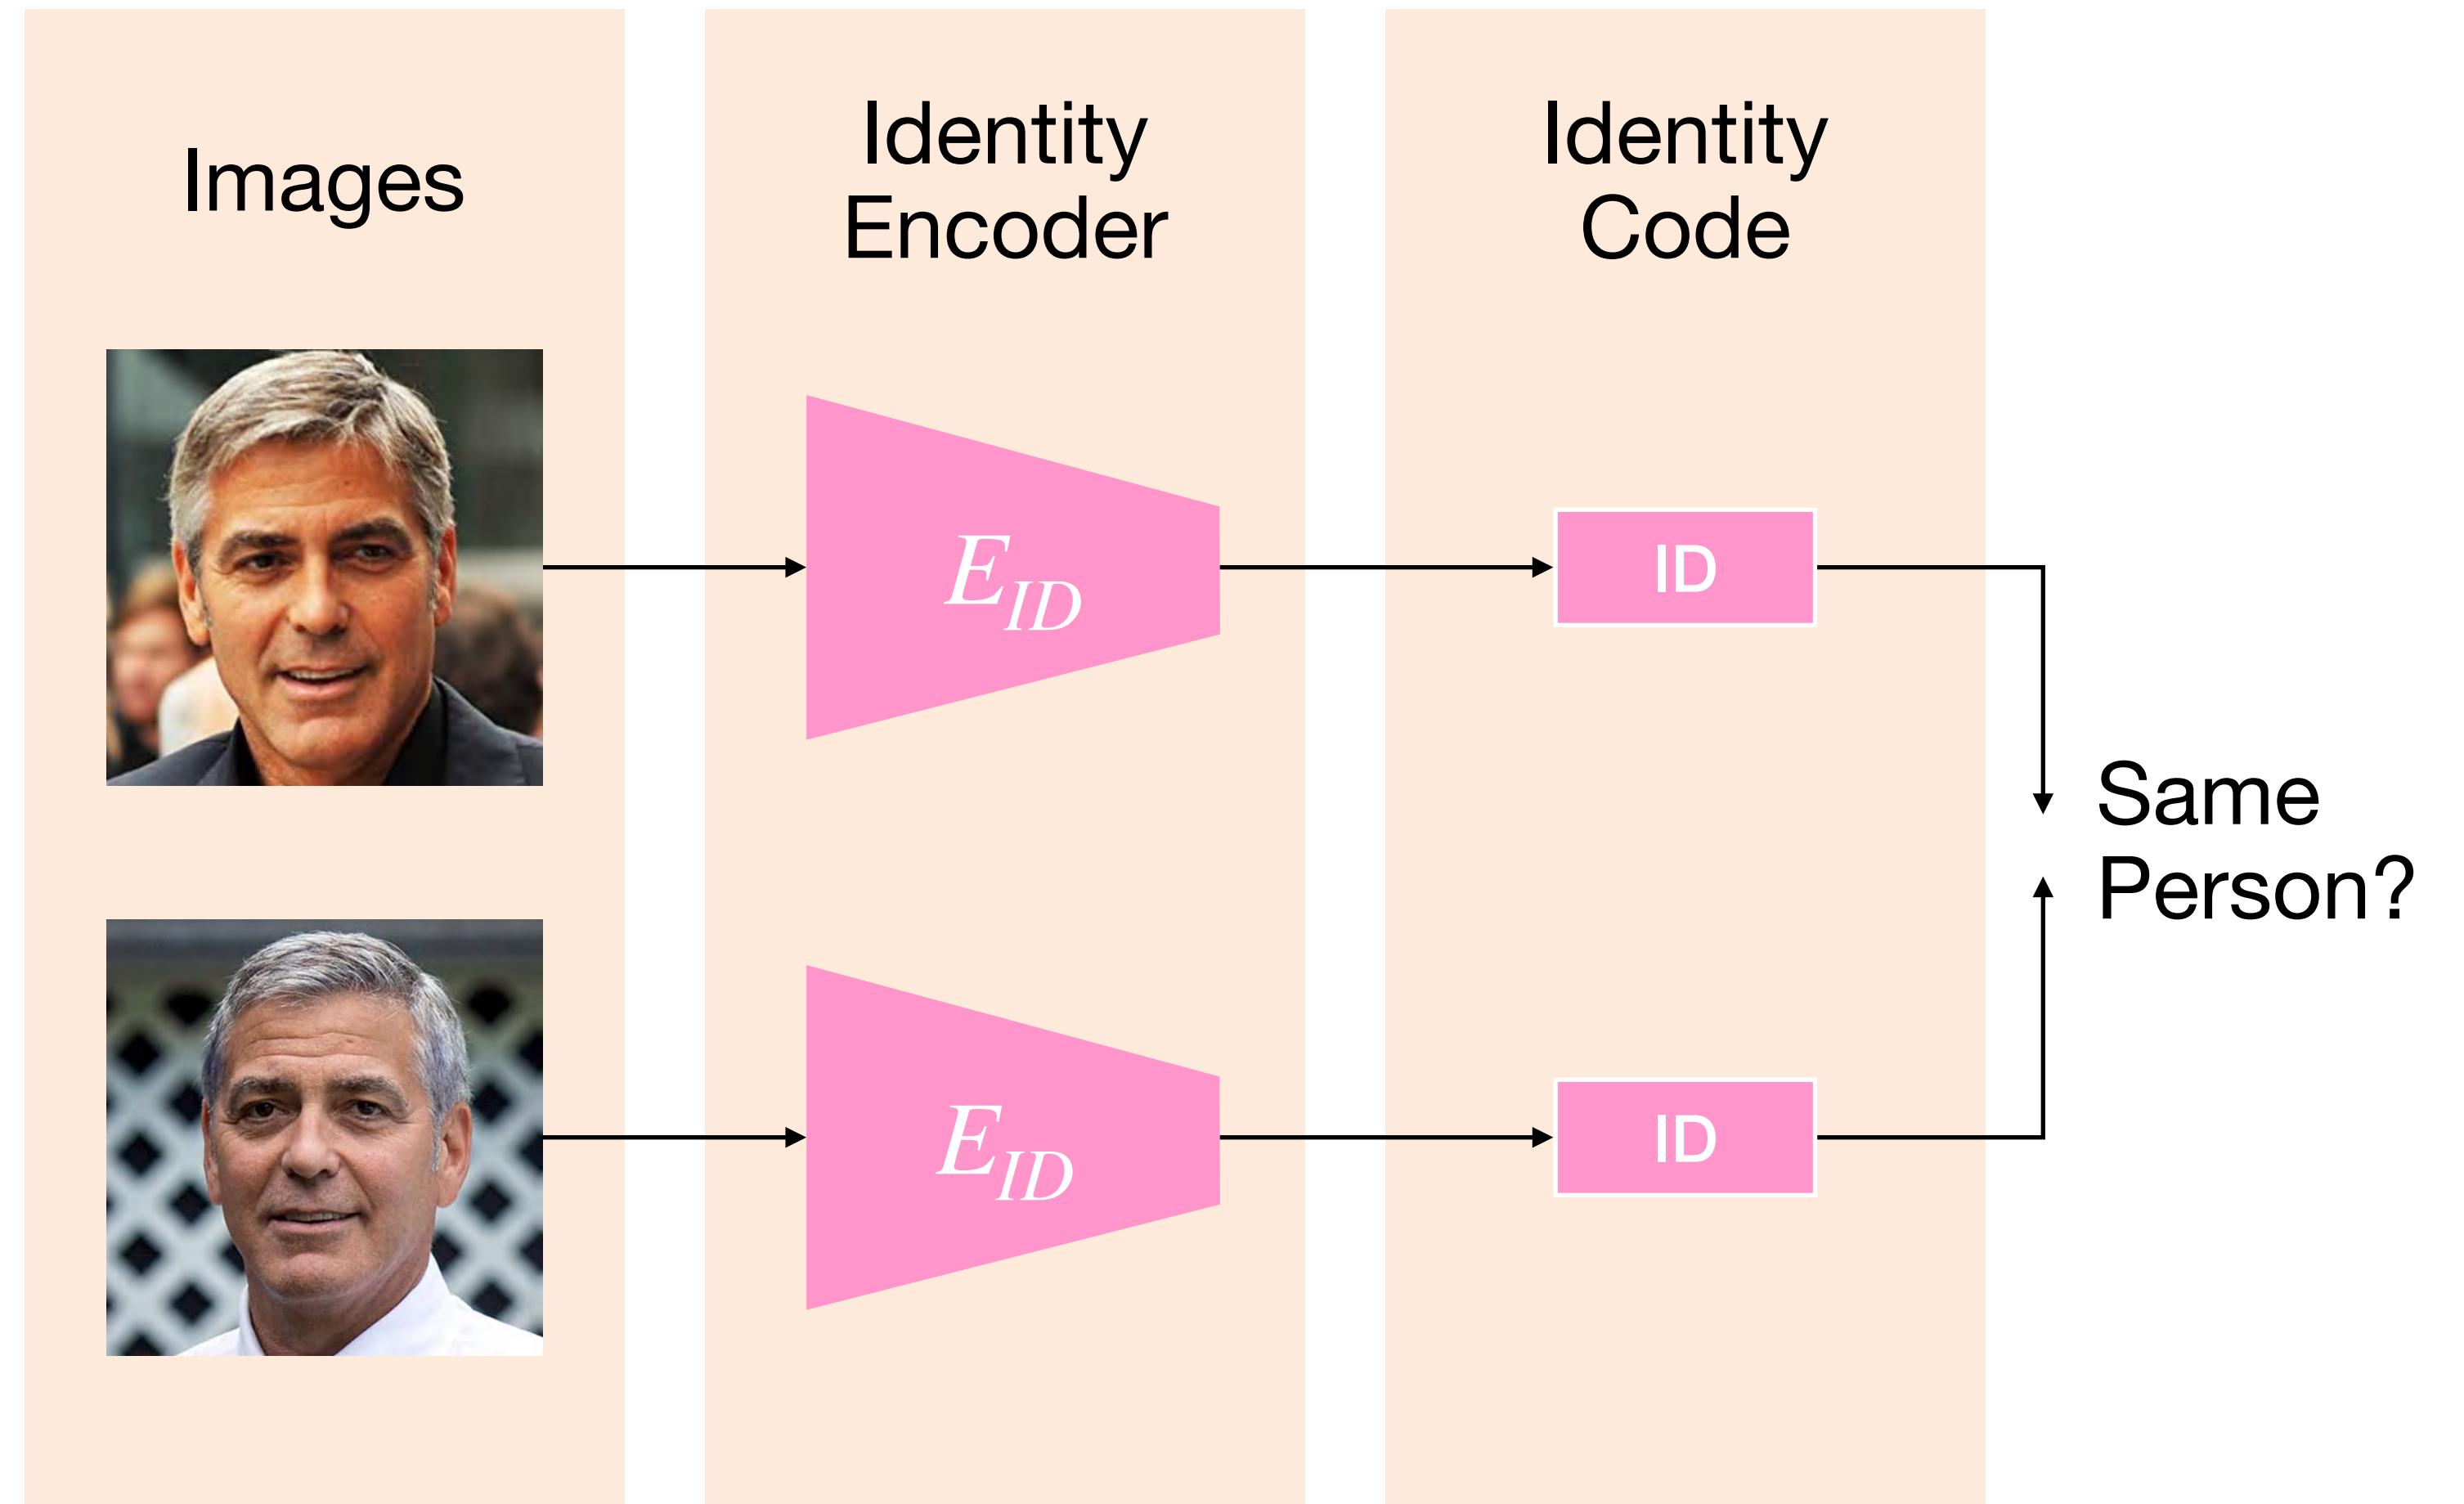

Epoch: 124, Batch Size: 4, $\gamma = 10.0$, $\lambda_g = 1.0$

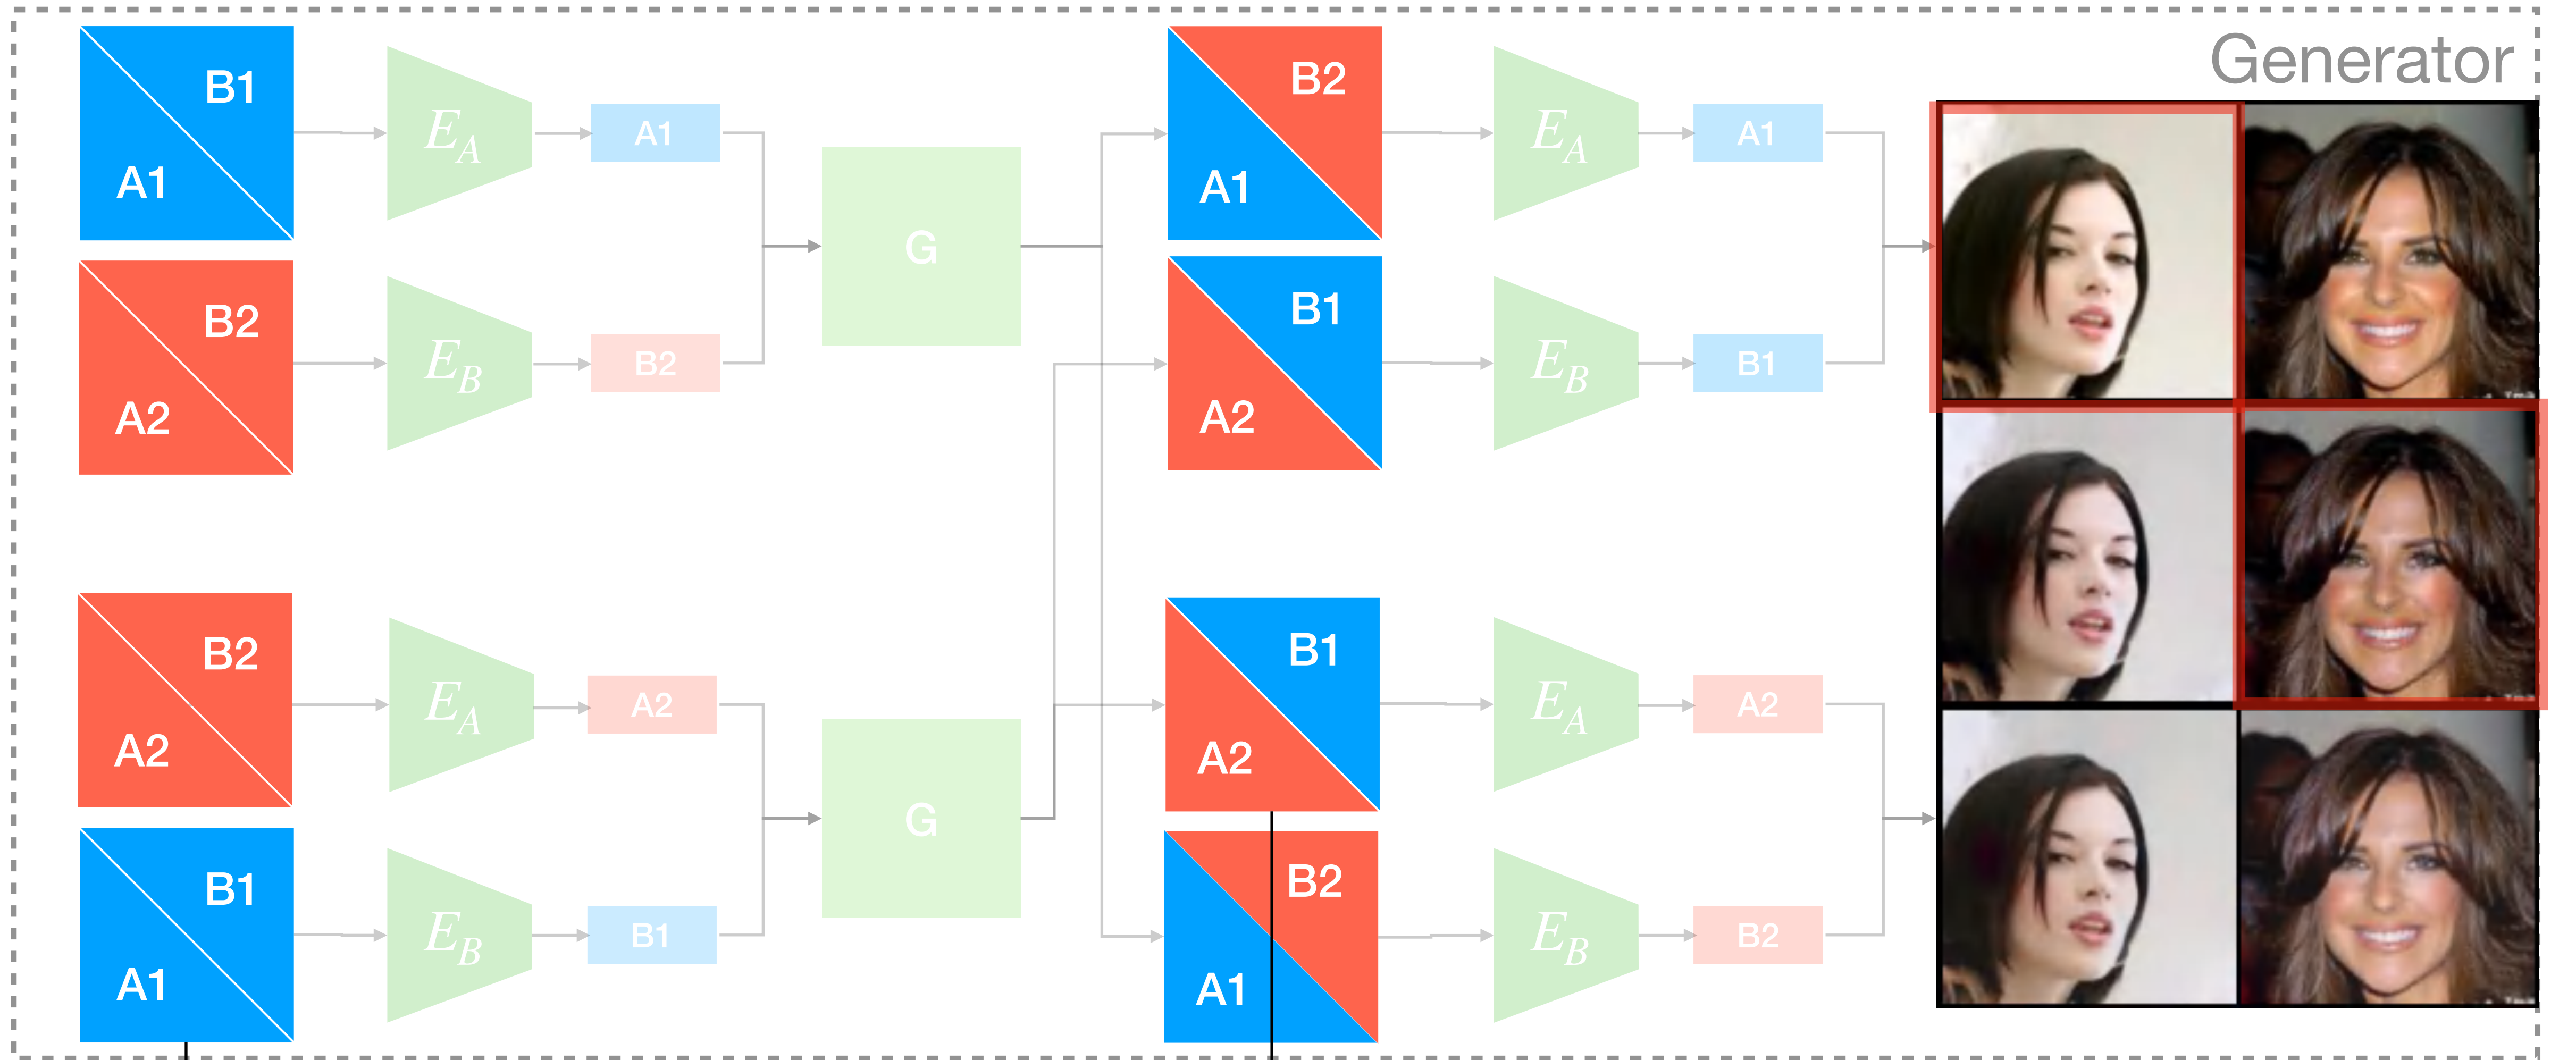

Timeline

Identity Loss

- Use pretrained **Face Detector** as an identity encoder
- Minimise distance between produced representation

Overall Losses

Generator

$$L_{gen} = \alpha \cdot L_{vgg} + \gamma \cdot L_{cyc} + \lambda_g \cdot L_{gen} + \delta \cdot L_{id}$$

= VGG Perceptual Loss

= Generator GAN Loss

= Cycle Consistency Losses

= Identity Loss

Discriminator

$$L_{dis} = \zeta \cdot \left(\frac{L_{real} + L_{fake}}{2} \right) \quad \text{with } \zeta = 0.2$$

Results

Original

Mixed

Reconstructed

Epochs: 0-8, Batch Size: 8, $\lambda_g = 1.0$, $\gamma = 10.0$, $\delta = 1.0$

Next Steps

- Increase weight of L_{ID} successively
- Quantify usefulness of G2G reassembly stage
- Idea: Erase facial landmarks (identity specific information) of image which represents *rest*
